 - 1.10 Submitting an Employee Issue
 - 1.11 Verifying Backend Record Creation

1. PROJECT DEVELOPMENT PHASE

1.1 Creating the Scoped Application

A custom scoped application was created in ServiceNow to keep the project components organized within a dedicated application.

1.2 Creating the Custom Table

A custom table named Employee raises issue was created to store employee issue records. The table acts as the backend data source for the application.

1.3 Configuring Fields

Fields were added and configured to capture employee and issue-related information. The fields provide structured data that can be stored and managed in the custom table.

1.4 Implementing UI Policies

UI Policies were created to control form behavior and ensure that important information is properly collected.

1.5 Creating the Record Producer

A Record Producer was created to allow employees to create issue records through a simplified Service Portal form.

The Record Producer maps the information entered by the employee to the appropriate fields in the custom Employee Issue table.

1.6 Creating the Commercial Services Widget

A custom Service Portal widget was developed to present the employee-facing service information in a visually organized manner.

The widget provides the portal user with service-related information and helps make the portal interface more user-friendly.

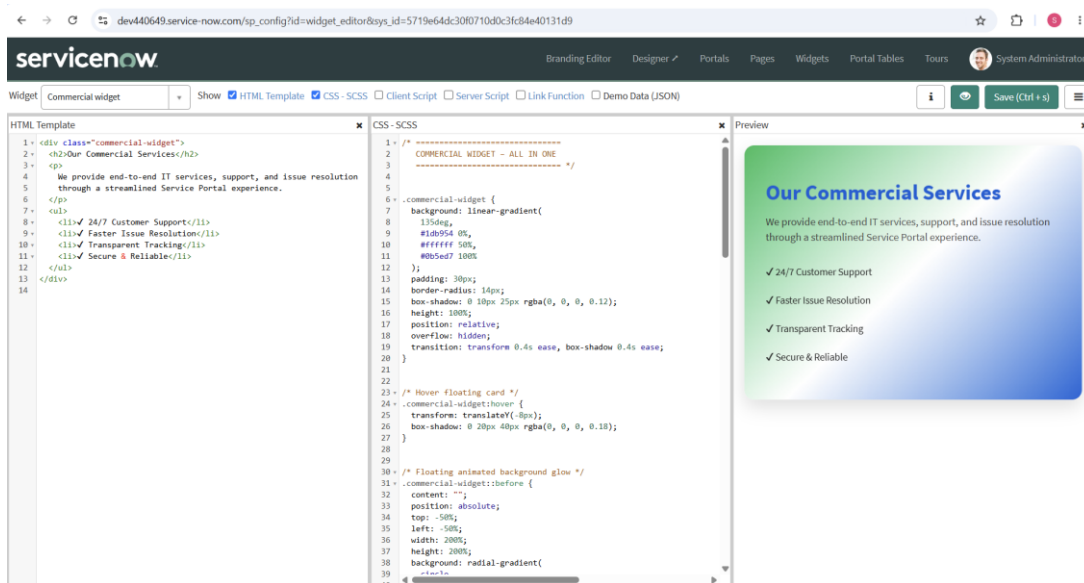

Figure 1. Custom Commercial Services Widget

1.7 Creating the Raise an Issue Widget

A custom Raise an Issue widget was developed to provide a direct entry point to the issue submission functionality.

The widget provides navigation from the Service Portal homepage to the Raise Employee Issue functionality.

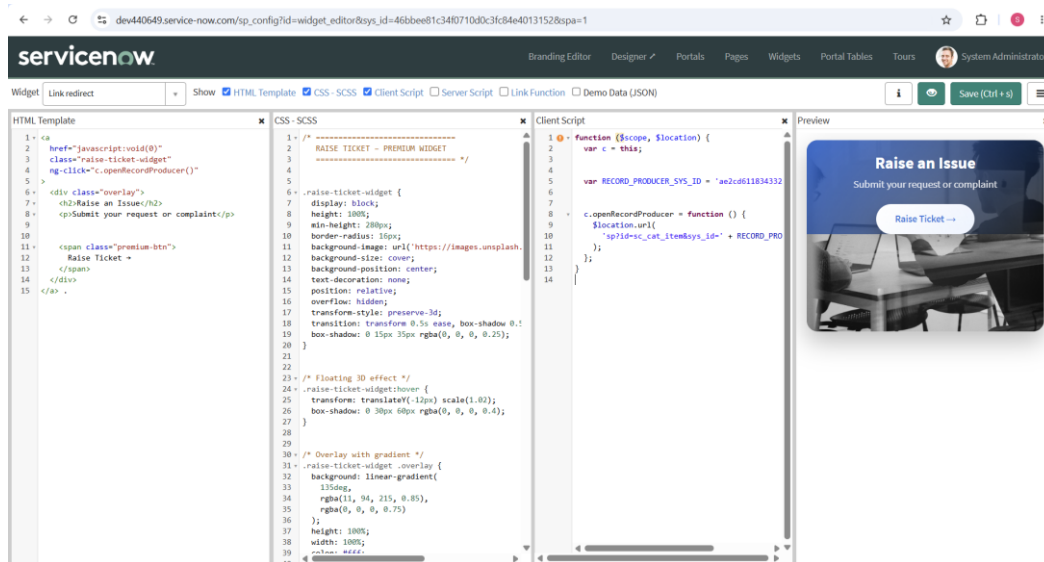

Figure 2. Custom Raise an Issue Widget and Navigation Configuration

1.8 Configuring the Service Portal Homepage

The custom widgets were placed on the Service Portal homepage using Service Portal Designer.

The homepage was configured to provide employees with an easy way to access the issue-reporting functionality.

1.9 Configuring the Raise Employee Issue Form

The Raise Employee Issue form provides the employee with an interface for entering the required issue information.

The employee can enter the relevant details and submit the form through the portal.

1.10 Submitting an Employee Issue

After entering the required information, the employee submits the issue.

The Record Producer processes the submitted information and creates a corresponding record in the custom Employee Issue table.

1.11 Verifying Backend Record Creation

After successful submission, the generated record can be verified in the custom Employee Issue table.

The system generates a unique issue number for the submitted record.

The image displays two side-by-side screenshots from the ServiceNow interface. The left screenshot shows the 'Employee raises issue' form for record EM0001024. The form includes fields for Number (EM0001024), Requester (Abraham Lincoln), Category (network), Subcategory (VPN), Short description (Network), State (New), Priority (None), and Assignment Group. The right screenshot shows the 'Standard Ticket' view for the same record, titled 'Network'. It displays the ticket details, including the number EM0001024, a 'New' status, and creation/last updated timestamps. Below the details, there are tabs for 'Activity' and 'Attachments', with a 'Drop files here' area for attachments. The ServiceNow logo is visible in the top left of both screenshots.
